AMENDMENT TO THE CLAIMS

1. (currently amended) Device for administering a composition in a wall of a duct of a human or animal body, which comprises means for entering an inner surface of the duct wall and making at least one opening in the form of a pinprick having a diameter from approximately 0.05 mm to 1.0 mm in a thickness of the wall, and a dispenser means for placing the composition in contact with the at least one opening, wherein the dispenser means surround the entry means.

2. (previously presented) Device according to Claim 1, wherein the entry means comprise perforating parts.

3. (previously presented) Device according to Claim 1, wherein the entry means are radially expandable relative to an axial direction of the device.

4. (previously presented) Device according to Claim 1, wherein the entry means are associated with an inflatable chamber.

5. (previously presented) Device according to Claim 4, wherein the entry means comprises perforating elements carried by a wall of the inflatable chamber and spaced apart along a longitudinal axis of the device.

6. (previously presented) Device according to Claim 2, wherein the entry means comprise arms carrying the perforating parts.

7. (previously presented) Device according to Claim 6, wherein the arms are associated with a tube on which an inflatable chamber is mounted.

8. (previously presented) Device according to Claim 1, wherein the dispenser means are radially extensible relative to an axial direction of the device.

9. (previously presented) Device according to Claim 1, wherein the dispenser means have channels able to receive the composition, the channels being open in a direction perpendicular to an axis of the device or closed by a wall containing openings.

10. (previously presented) Device according to Claim 1, wherein the dispenser means comprise a wall having outer openings.

Claims 11-12 (canceled)

13. (previously presented) Device according to Claim 4, wherein the inflatable chamber expands the dispenser means in a radial direction.

14. (previously presented) Device according to Claim 1, adapted to administer a composition in the wall of a blood vessel, artery, or an artery carrying a stent.

15. (Original) Device according to claim 1, comprising a catheter.

16. (previously presented) Device for administering a composition in a wall of a duct of a human or animal body, which comprises means for entering an inner surface of the duct wall and making at least one opening in the form of a pinprick having a diameter from approximately 0.05 mm to 1.0 mm in the thickness of the wall, said means carrying perforating parts and being expandible radially relative to an axis of the device, the device including dispenser means for placing the composition in contact with the at least one opening, the dispenser means being radially expandible and adapted to surround the entry means.

Claims 17-18 (Canceled)

19. (new) Device for administering a composition in a wall of a duct of a human or animal body, which comprises means for entering an inner surface of the duct wall and making at least one opening in the form of a pinprick having a diameter from approximately 0.05 mm to 1.0 mm in a thickness of the wall, and a dispenser means for placing the composition in contact with the at least one opening, wherein the dispenser means are arranged to slide in relation to the entry means along an axial direction of the device.
